

## About Systemation

Systemation looks for and finds the best technology for specific business issues in relation to Digital Transformation initiatives. Solutions that are interesting for various organizations with the same challenges.

Systemation then ensures that the customer successfully uses this technology and that it derives maximum and sustainable benefit from it. That means: support with implementation, training, product and application management.

'Doing more with data' is the theme at the moment for Systemation's customers. To innovate, they need high-quality internal data that is complete and up-to-date, and enriched with external data in a safe and reliable manner for internal users and external partners.

The solutions that fit this theme:

- Master and Reference Data Management (EBX-Orchestra Networks),
- Datawarehouse Automation (WhereScape©),
- API Data Security (Forum Sentry - Forum Systems).

Systemation builds value for its customers, business partners and shareholders by creating a work atmosphere for employees where customer orientation, professionalism, teamwork, creativity, and an open and transparent approach are key.
